Abstracts

The cell wall of *Candida* is a complex glycoprotein that depends on the biosynthesis of ergosterol. Azole compounds, found in antimycotic drugs, are believed to block ergosterol production, allowing topical antimycotics to achieve cure rates in excess of 80%. The only oral azole agent approved for this indication by the US Food and Drug Administration (FDA) is fluconazole, which also achieves a high cure rate. Therapeutic concentrations are found in vaginal secretions for at least 72 hours after the ingestion of a single 150-mg tablet.

Some women with recurrent candidal infections opt for treatment with over-the-counter (OTC) medications, which generally are highly effective for candidiasis. Preparations for intravaginal administration of butoconazole, clotrimazole, miconazole, and tioconazole are available OTC.
