The drum dryer is a common industrial drying equipment, which is mainly used to dehydrate and dry materials through the combination of rotating drum and hot air flow. Its basic structure includes rotating drum, transmission device, heating system and dehumidification device. The drying process usually puts the wet material into the drum from the feed end, and uses the rotation of the drum to drive the material to turn evenly inside. At the same time, the hot air flows along the drum, fully contacts with the material, evaporates the water and discharges it through the exhaust system.
