The scraper drum dryer is a kind of internal heating conduction type rotating continuous drying equipment. The working principle of the scraper drum dryer is to allow liquid or slurry materials to form a thin film on the drum surface heated by water vapor or other heat carriers. During the rotation of the drum, the heat is transported to the inner wall of the drum through the pipeline, then conducted to the outer wall of the drum, and finally conducted to the material film, so that the moisture in the material film is evaporated and dehumidified, so that the material containing moisture is dried. When the material is dried, the product is scraped off with a scraper, and the exposed drum surface contacts the raw material again and forms a thin film for drying.
