Abstracts

The global Dry Etcher market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Dry Etcher is designed to finish the process of dry etching. Dry etching refers to the removal of material, typically a masked pattern of semiconductor material, by exposing the material to a bombardment of ions (usually a plasma of reactive gases such as fluorocarbons, oxygen, chlorine, boron trichloride; sometimes with addition of nitrogen, argon, helium and other gases) that dislodge portions of the material from the exposed surface. A common type of dry etching is reactive-ion etching. Unlike with many (but not all, see isotropic etching) of the wet chemical etchants used in wet etching, the dry etching process typically etches directionally or anisotropically.

This report studies the global Dry Etcher production, demand, key manufacturers, and key regions.

This report is a detailed and comprehensive analysis of the world market for Dry Etcher, and provides market size (US\$ million) and Year-over-Year (YoY) Growth, considering 2022 as the base year.
