Abstracts

According to our (Global Info Research) latest study, the global Dry Film Photoresist and Wet Film Photoresist market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

Dry film photoresist can be divided into photopolymerization type and photodecomposition type. The photopolymerization type dry film is cured under the light irradiation of a specific spectrum, and the water-soluble substance is transformed into a water-insoluble substance, and the photodecomposition type is just the opposite. Wet film photoresist represents photosensitive liquid resist, and the introduction of tackifying resin improves the comprehensive acid and alkali resistance of the resist, generally in the form of a blue viscous liquid.
