## Abstracts

According to our (Global Info Research) latest study, the global Dry Powder Demagnetizer market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

Dry powder demagnetizer is a device used to remove magnetic impurities on the surface of objects. It uses dry magnetic powder as the demagnetization medium, and uses magnetic force to adsorb magnetic impurities on the surface of the object to the powder, thereby achieving the purpose of demagnetization. Dry powder demagnetizer usually consists of magnetic powder feeding system, magnetic field system and collection system. The magnetic powder feeding system sprays magnetic powder evenly on the surface of the object to be demagnetized. The magnetic field system generates a strong magnetic field, causing the magnetic powder to form a uniform magnetic field on the surface of the object. When there are magnetic impurities on the surface of an object, the magnetic powder will adsorb these impurities and remove them from the surface of the object through the action of a magnetic field. Finally, the collection system collects the removed magnetic powder and magnetic impurities for processing or reuse. Dry powder demagnetizers are widely used in metal processing, machinery manufacturing, electronics industry and other fields to remove magnetic impurities on the surface of objects and improve product quality and performance. Compared with other demagnetization methods, dry powder demagnetization machines have the advantages of good demagnetization effect, easy operation, and no need to use chemicals, so they have been widely used and promoted.
