## Abstracts

The global DTPA-5Na market size is expected to reach \$ 187 million by 2032, rising at a market growth of 4.2% CAGR during the forecast period (2026-2032).

DTPA-5Na is an efficient chelating agent widely used in multiple industrial fields. It has excellent chelating ability and can form stable water-soluble complexes with various metal ions. Therefore, it is used as a water softener, metal rust inhibitor, and bleaching stabilizer in industries such as detergents, textiles, papermaking, and electroplating. In addition, DTPA ? Na<sub>5</sub> has applications in agriculture, such as chelation of trace nutrients to improve the absorption efficiency of essential elements such as iron and zinc by plants. In 2025, global DTPA-5Na production reached approximately 128.34 K MT, with an average global market price of around US\$ 1,054 per MT.

Diethylenetriaminepentaacetic acid pentasodium (DTPA ? 5Na) is a very important chelating agent, with a molecular structure similar to an octopus with multiple 'tentacles' that can firmly grasp metal ions in solution. This unique property makes it play an indispensable role in numerous industrial fields and daily life.

DTPA ? 5Na plays the role of a 'water softener' and 'quality stabilizer' in daily chemical products such as detergents, shampoos, shower gels, and skincare products. It can effectively chelate calcium and magnesium ions in water, preventing these ions from combining with surfactants to form insoluble 'soap deposits', thereby improving the cleaning effect of the product and avoiding residue on fabrics or skin. At the same time, it can also integrate heavy metal ions to prevent them from catalyzing the oxidation and deterioration of oil and other components, effectively delaying product discoloration and flavor change, and extending shelf life.

In the industrial field, DTPA ? 5Na is an efficient 'descaling expert' and 'system guardian'. In boiler and cooling water circulation systems, it forms stable water-soluble complexes with scaled calcium and magnesium ions, effectively dissolving existing scale and strongly preventing the formation of new scale. When used as a chelating cleaning agent for non-stop cleaning, its net usage is usually very low, demonstrating excellent economy and efficiency. It is also used for fabric refinement before textile printing and dyeing to remove impurities and improve subsequent processing quality.

In these two industries, DTPA ? 5NA is an excellent 'process assistant'. In the process of textile printing and papermaking bleaching, it chelates metal ions such as iron, manganese, and copper in the system to prevent these ions from catalyzing the decomposition of bleaching agents such as hydrogen peroxide, thereby playing a key role in stabilizing the bleaching bath, reducing ineffective consumption of bleaching agents, improving whiteness and product quality.

In agriculture, DTPA ? 5Na can serve as an efficient carrier for trace element fertilizers, and its chelates can be better absorbed and utilized by plants. In the fields of medicine and scientific research, it also has its specific uses. According to the national standard GB 9685-2016, DTPA ? 5 sodium is also approved for use in food contact paper and cardboard materials and products, and can be used in moderation according to production needs, which reflects its safety under specific conditions.
