Abstracts

The global Dual-band GNSS Receiver market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

A dual-band GNSS receiver refers to a receiver that is capable of receiving signals from multiple satellite constellations on two different frequency bands simultaneously. Typically, these receivers can receive signals on the L1 and L2 frequency bands, which are commonly used by satellite systems such as GPS, GLONASS, Galileo, and BeiDou. By receiving signals on two frequency bands, dual-band GNSS receivers can improve positioning accuracy and reliability. They utilize the additional measurements from the second frequency band to mitigate errors caused by atmospheric effects, multipath interference, and other sources of signal distortion. This capability is particularly important for applications that require high-precision positioning, such as surveying, construction, precision agriculture, and autonomous navigation.

This report studies the global Dual-band GNSS Receiver production, demand, key manufacturers, and key regions.
