According to our (Global Info Research) latest study, the global Dual Element Transducer market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

The range of applications for dual element transducers is expanding beyond traditional areas such as flaw detection and thickness measurement to other industries like petroleum and oil&gas, with the emerging technology of second-generation guided wave ultrasonic techniques.

A dual element transducer is a type of ultrasonic transducer that contains two piezoelectric elements. These elements are usually arranged in a single housing, with one element emitting an ultrasonic pulse and the other receiving the echo. Dual element transducers are commonly used in non-destructive testing (NDT) applications. They are used to inspect the entire thickness of a material, as each element allows for a different angle of inspection. The first element generates a short ultrasonic pulse that is reflected by internal defects, and the second element receives the reflected pulse.
