## **Abstracts**

According to our (Global Info Research) latest study, the global Dual Element Ultrasound Probe market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

The dual element ultrasonic probe is an ultrasonic sensor used for non-destructive testing and material evaluation. Its two chips are installed in the same shell, and there is a sound insulation barrier between the chips to separate the chips. One chip emits longitudinal waves, and the other chip acts as a receiver to receive echoes.

The dual element ultrasonic probe is based on the propagation and reflection of ultrasonic waves. The receiving crystal converts the received ultrasonic signals into electrical signals, amplifies and processes them through connected circuits, and finally obtains information about the internal structure and information of the detected object. The dual crystal ultrasonic probe has the characteristics of transmitting and receiving functions, high signal-to-noise ratio, adjustability, versatility, and high precision, and is widely used.
