A double gas booster is a device that can boost the pressure of two gases at the same time. It is usually used in industrial applications where different gases (such as air, nitrogen, oxygen, etc.) need to be processed simultaneously. The booster increases the pressure of the gas through a double compression system to meet the gas pressure requirements of different processes. It has the characteristics of compact structure, easy operation and high efficiency. It is widely used in industries such as petrochemicals, metallurgy, and electronic manufacturing, especially in gas transportation, pneumatic equipment driving, and high-pressure gas storage.
