## Abstracts

The global Dual Motor Electric Vehicle market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

A dual-motor electric vehicle is a vehicle that uses two electric drive motors. Conventional electric vehicles typically have only one electric drive motor, which drives the vehicle's wheels in motion. Dual-motor electric vehicles, on the other hand, use two electric drive motors, connected to the front and rear wheel sets respectively, to provide greater power and drive control. A dual-motor system enables four-wheel drive, or all-wheel drive, because each motor independently controls a wheel set. Such configuration can bring better traction, handling and dynamic performance. Through an intelligent motor control system, dual-motor electric vehicles can realize independent drive and torque distribution of the front and rear wheels to adapt to different road conditions and driving needs. Dual-motor EVs can also improve energy efficiency through synergistic work between the motors. In some cases, one of the motors can take on a larger load while the other reduces power consumption for better energy efficiency and range.

In general, dual-motor electric vehicles use two electric drive motors to provide better driving performance, handling and energy efficiency, and bring a better driving experience to drivers.
