Dual-sided translaminar fungicide is a fungicide that can penetrate through the epidermis of plant leaves and diffuse laterally within the leaf tissue. After application, the agent can penetrate the mesophyll cells from the sprayed surface and diffuse to the back of the leaf, forming an 'inner leaf protective layer', thereby providing a more comprehensive protective effect. Unlike contact fungicides that only act on the surface, leaf-penetrating fungicides have stronger treatment and prevention capabilities against early disease infections, and are not easily washed away by rain, which improves rain resistance and lasting effect. It is often used to prevent and control leaf fungal diseases such as powdery mildew, leaf spot, and rust, and is widely used in a variety of crops such as fruit trees, vegetables, and grains.
