## Abstracts

The global Ducted Type Air Conditioning market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

In a ducted type air conditioning system, the main components include:

**Centralized unit:** This unit, often located outside the building or in a dedicated mechanical room, houses the main cooling and heating components such as the compressor, condenser, and evaporator. It is responsible for generating cold or hot air as required.

**Ductwork:** A network of ducts is installed throughout the building, hidden behind walls, ceilings, or floors. These ducts serve as conduits for the conditioned air to flow to different areas or rooms. Supply ducts deliver the conditioned air, while return ducts bring back the air to be reconditioned.

**Air vents and registers:** Air vents or registers are installed in the walls, ceilings, or floors to allow the conditioned air to enter the rooms. These vents can be adjusted to control the airflow and temperature in each area.

**Thermostat:** A central thermostat or multiple thermostats are used to control the temperature settings of the air conditioning system. They allow users to set the desired temperature and provide control over the operation of the system.

Advantages of ducted type air conditioning systems include:

**Whole-building cooling/heating:** The system can cool or heat an entire building or

specific zones within it, providing consistent comfort throughout.

**Hidden installation:** The ducts are concealed behind walls, ceilings, or floors, resulting in a clean and unobtrusive appearance.

**Temperature control:** Individual thermostats in different areas allow for customized temperature settings, providing flexibility and energy efficiency.

**Noise reduction:** Since the main unit is located outside or in a separate mechanical room, noise levels inside the building are minimized.

Ducted type air conditioning systems require careful design and installation to ensure proper air distribution and efficient operation. Regular maintenance and cleaning of the ductwork are necessary to maintain good indoor air quality and system performance.

Ducted type air conditioning refers to a centralized air conditioning system that uses a network of ducts to distribute conditioned air throughout a building or specific zones within a building. It is commonly used in residential, commercial, and industrial settings.
