Abstracts

The global Dummy Silicon Wafer market size is expected to reach \$ 2132 million by 2032, rising at a market growth of 5.9% CAGR during the forecast period (2026-2032).

Dummy wafers (also called as test wafers) are wafers mainly used for experiment and test and being different from general wafers for product.

Accordingly, reclaimed wafers are mostly applied as dummy wafers (test wafers).

Dummy wafers are often used in a production device to improve safety in the beginning of production process and are used for delivery check and evaluation of process form.

As dummy wafers are often used for experiment and test, size and thickness thereof are important factors in most occasions.

In each process, film thickness, pressure resistance, reflection index and presence of pinball are measured using dummy wafers (test wafers). Also, dummy wafers (test wafers) are used for measurement of pattern size, check of defect and so on in lithography.

Dummy wafers follow two primary supply/technology routes. First, silicon dummy wafers, which can be virgin test-grade silicon or (very commonly) reclaimed wafers recycled through stripping, polishing, and cleaning. Reclaim inherently removes some silicon each cycle, so the wafer eventually becomes too thin and must be replaced. Second, long-life non-silicon dummy wafers targeting harsh “high-temperature / thick-film / frequent-clean” environments to reduce replacement frequency and total cost. Entegris positions SUPERSiC (SiC) dummy wafers as durable, high-purity wafers that

can withstand extended high-temperature cycling and repeated cleaning in PECVD or diffusion; its materials note that reclaimed silicon dummy lifetime is driven by cleaning frequency, while SiC dummy wafers can remain stable over multi-year lifetimes (reported >3 years). Another example is quartz-based dummy/filler wafers for furnace deposition: Heraeus markets Black Quartz HBQ® wafers as an ideal material for filler and dummy wafers in batch furnace deposition processes and highlights thermal-expansion matching considerations.

Core applications include furnace filler/loading stabilization, post-maintenance conditioning/seasoning, recipe-change stabilization/verification, and handling/transport/mechanical evaluation runs. The competitive landscape is bifurcated: (1) reclaim/value-add providers supplying reclaimed dummy/monitor wafers plus optional film/cleaning services; RS Technologies explicitly states that fabs use monitor and dummy wafers for testing and trial processing and can reuse them after precision reclaim, and also notes it supplies monitor and dummy wafers and film coating services. (2) specialty long-life dummy wafer material suppliers (SiC, black quartz, etc.) differentiating on durability, chemical resistance, and reduced changeout frequency to improve effective tool output.
