According to our (Global Info Research) latest study, the global Duplex Capillary market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

A biphasic capillary refers to a single physical structure in which a special design or manufacturing process is used to make the interior of the capillary present two different structural phases or regions. These phases or regions differ in function, material, geometry or fluid transmission characteristics, and together affect the overall performance of the capillary.

The interior of the capillary contains two different channels, layers or regions, which differ in size, shape, arrangement, etc. These regions may be composed of different materials, or the structural differences may be achieved through different treatments in the same material (such as surface modification, porosity adjustment, etc.). Structural biphasic capillaries may have different fluid transmission paths and speeds, resulting in different transmission behaviors of fluids in different phases or the same fluid in different phase regions. This design can optimize the distribution, mixing, separation or reaction process of the fluid and improve the performance of the capillary in specific applications.
