Abstracts

The global Dura (Spinal) Patch market size is expected to reach \$ 1332 million by 2032, rising at a market growth of 5.9% CAGR during the forecast period (2026-2032).

Dura (spinal) patch refers to a sheet-like material product used for temporary or permanent repair of dura and/or dura defects.

Upstream inputs mainly include biological raw materials (such as purified collagen matrices, bovine pericardium, or porcine small-intestinal-submucosa-derived extracellular matrix), synthetic polymer materials (such as ePTFE and other medical polymers), and supporting materials/process inputs including sterilization media, packaging systems, and quality-control/biocompatibility testing. Downstream, the product is primarily used in cranial and spinal neurosurgery for dural defect repair/reconstruction (including tumor surgery, skull-base procedures, trauma-related repair, and other procedures involving dural opening), with the core clinical goal of restoring the dural barrier and helping reduce complications such as cerebrospinal fluid (CSF) leakage.

In 2025, global sales of Dura (Spinal) Patch reached approximately 2,127 K Pcs, with an average global market price of around US\$ 406/Pcs. Production capacity varies significantly among manufacturers, with gross profit margins ranging from approximately 80% to 95%.

Large Market Potential:

Neurosurgery, one of the most complex medical disciplines, is a clinical surgical specialty that primarily uses surgery to treat diseases of the central nervous system

(brain and spinal cord), peripheral nervous system, and autonomic nervous system. With the continuous improvement of living standards in China, the accelerated aging of the population, and factors such as accidental injuries, brain diseases primarily treated with surgery, such as brain tumors, craniocerebral trauma, cerebral hemorrhage, and functional neurological disorders, are also on the rise. Furthermore, with increasing awareness of diseases and the development of surgical instruments, treatment methods are changing. More and more conditions, such as epilepsy and pain, can now be effectively treated surgically. Overall, the field of neurosurgery has significant development potential. The market for high-value consumables used in neurosurgery is enormous.

High Degree of Domestication:

Compared to other high-value consumables, dural patches have a high degree of domestication, accounting for approximately 80% of the Chinese market share.

Increased policy support:

To reduce the burden of individual medical expenses and improve access to high-value medical consumables, the National Medical Insurance Administration (NMIA) has issued several new policies encouraging the expansion of reimbursement for these consumables, increasing the proportion of unified reimbursement, and achieving full coverage from urban residents' medical insurance to rural cooperative medical care. In response to these policies, local governments have continuously adjusted their medical insurance catalogs based on their respective fiscal strengths. These adjustments have led to a gradual decrease in out-of-pocket patient expenses and increased access to high-value medical consumables, driving continued growth in the dura mater patch market.
