## Abstracts

According to our (Global Info Research) latest study, the global Dry Etch Systems market size was valued at USD 10580 million in 2023 and is forecast to a readjusted size of USD 14670 million by 2030 with a CAGR of 4.8% during review period.

An Dry Etch System shapes the thin film into a desired patterns using reaction gases (such as fluorocarbons, oxygen, chlorine, boron trichloride; sometimes with addition of nitrogen, argon, helium and other gases). There are three types of dry etching (e.g., plasma etching): chemical reactions (by using reactive plasma or gases), physical removal (generally by momentum transfer), and a combination of chemical reactions and physical removal. Common types of dry etching are reactive ion etching and deep reactive ion etching. The dry etching process typically etches directionally or anisotropically.
