According to our (Global Info Research) latest study, the global DUV Lithography Systems market size was valued at US\$ 15040 million in 2024 and is forecast to a readjusted size of USD 22850 million by 2031 with a CAGR of 6.2% during review period.

A wide range of products such as smartphones and electrical appliances are becoming smaller and more functional, and all are now part of everyday life. Semiconductor lithography technology is making a significant contribution to the evolution of semiconductors (semiconductor integrated circuits), which are indispensable components of these products.

A semiconductor lithography system undertakes a process whereby highly complex circuit patterns drawn on a photomask made of a large glass plate are reduced using ultra-high-performance lenses and exposed onto a silicon substrate known as a wafer.

Semiconductor lithography equipment include EUV lithography machine, ArFi immersion lithography machine, ArF dry lithography machine, KrF lithography machine and i-line lithography machine.

Advancements in fabrication techniques, especially extreme ultraviolet (EUV) and deep ultraviolet (DUV) lithography, are revolutionizing the semiconductor manufacturing process, enabling increasingly miniaturized and efficient semiconductor components with significant improvements in transistor density, performance, and energy efficiency.

Extreme ultraviolet (EUV) lithography is a cutting-edge semiconductor fabrication

technique that employs very short wavelengths of 13.5 nm, which is 14 times smaller than the other advanced lithography technique, deep ultraviolet (DUV) lithography with wavelengths of 193 nm. Such short wavelengths enable microchip circuit and transistor production at extremely small nodes, such as 7nm, 5nm and 3nm, achieving unprecedented precision and resolution levels in semiconductor manufacturing.

The global semiconductor lithography machine market is monopolized by three companies, including ASML, Nikon and Canon. ASML is the largest manufacturer, accounting for more than 90% of the market share; Nikon and Canon account for 5% and 5% of the market share respectively.

The global market for semiconductor was estimated at US\$ 526.8 billion in the year 2023, is projected to US\$ 780.7 billion by 2030. IC Manufacturing is the process used to manufacture semiconductor devices, typically integrated circuits (ICs) such as computer processors, microcontrollers, and memory chips (such as NAND flash and DRAM). According to our research, the global semiconductor manufacturing (wafer fabrication) market is projected to grow from US\$ 251.7 billion in 2023 to US\$ 506.5 billion by 2030, at a Compound Annual Growth Rate (CAGR) of 40.49% during the forecast period. This will drive rapid growth of global Semiconductor Lithography Equipment.
