Abstracts

The global Dye-sublimation Printing (Sublimation Transfer Printing) market size is expected to reach \$ million by 2030, rising at a market growth of % CAGR during the forecast period (2024-2030).

Dye-sublimation printing (or dye-sub printing) is a term that covers several distinct digital computer printing techniques that involve using heat to transfer dye onto a substrate. The sublimation name was first applied because the dye was thought to make the transition between the solid and gas states without going through a liquid stage. This understanding of the process was later shown to be incorrect, as there is some liquefaction of the dye. Since then, the process has become properly known as dye diffusion, though this technically correct term has not supplanted the original name.
