According to our (Global Info Research) latest study, the global Dynamic Ice Storage Systems market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

In the dynamic ice storage system, water exchanges heat with the heat transfer wall through forced convection, but ice formation does not occur on the heat transfer wall. Therefore, the unfavorable situation of ice layer adhering to the heat transfer wall and hindering heat transfer is avoided.

Ice storage systems make ice by using electrical power at night, and release cold quantities to meet the peak usage of cold during daytime. Dynamic ice storage system uses plate evaporators which are connected in parallel on the ice storage tank. The compressor-condenser units are usually connected by several high temperature screw compressors.
