Abstracts

The global E-Beam Curing market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

E-Beam Curing is a type of radiation curing technology. High-energy electron beams directly interact with the system to be cured to cause polymerization, grafting or cross-linking reactions, thereby curing the material. The electron beam (EB) curing process generates less heat than UV and LED curing, providing a more complete cure with virtually no odor. EB units use up to 95% less energy than thermal drying and up to 80% less energy than UV curing.

This report studies the global E-Beam Curing demand, key companies, and key regions.

This report is a detailed and comprehensive analysis of the world market for E-Beam Curing, and provides market size (US\$ million) and Year-over-Year (YoY) growth, considering 2022 as the base year.
