Abstracts

eFuels are produced with the help of electricity from renewable energy sources, water and CO₂ from the air. In contrast to conventional fuels, they do not release additional CO₂ but are climate-neutral. Thanks to their compatibility with today's internal combustion engines, eFuels can also power vehicles, airplanes and ships, thus allowing them to continue to operate but in a climate-friendly manner. The same applies to all heating systems that use liquid fuels. Existing transport, distribution and fuel infrastructures (especially filling stations) can also continue to be used.

According to our (Global Info Research) latest study, the global E-Fuel market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.
