Abstracts

The global E-Paper Display Technology market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Electronic paper or e-paper display has many benefits over traditional display technologies, like LCD and LED. E-paper displays is a reflective display and can be made using different types of technology, such as electrophoresis, electrowetting, and electrochromism. Electronic paper or e-paper is a display technology that mimics the appearance of ordinary ink on paper to produce a low-power, paper-like display. E-paper displays typically have a so-called image memory, which means they do not need much power to maintain the display; they mostly need power when there is a change in the display. Therefore, e-paper displays are best for low-frequency switching displays, such as signage and labels. E-paper displays reflect light rather than emit light, making them very comfortable to read even under direct sunlight. They are extremely popular because of their low power consumption, high reflectivity, high contrast, readability, thickness, and wider viewing angle. E-paper displays are widely used in e-readers, real-time bus arrival information, electronic shelf label (ESL) segments, digital menu boards, traffic signs and, logistics monitoring devices.
