## Abstracts

The global Earth Leakage and Residual Current Safety Devices market size is expected to reach \$ 4617.9 million by 2030, rising at a market growth of 4.9% CAGR during the forecast period (2024-2030).

In an electrical circuit the power going into the circuits through the live wire should always be the same as the power returning through the neutral wire because it is travelling around a closed circuit. If there is a fault in the circuit and power is leaking away to earth somewhere then the power passing into the circuit through the live connection will not be the same as the power passing out of the circuit through the neutral wire. This difference is known as residual current. We place a small coil of wire around the live and neutral wires inside the switch which can detect if the power is different, it then uses this power difference or residual current to switch the power off.
