Abstracts

According to our (Global Info Research) latest study, the global Earthquake Data Acquisition Service market size was valued at US\$ 277 million in 2025 and is forecast to a readjusted size of US\$ 375 million by 2032 with a CAGR of 4.2% during review period.

Seismic data acquisition services refer to professional field services that use geophones, nodal acquisition instruments, ocean-bottom nodes, streamer systems, seismic sources, positioning and timing systems, and recording platforms to collect, record, and quality-control seismic waves generated by active sources or natural earthquakes. Typical activities include survey design, line planning, equipment deployment, source operation, signal recording, field quality control, and raw-data delivery. These services are used in oil and gas exploration, mineral exploration, geothermal development, carbon-storage monitoring, engineering geophysics, and natural-earthquake monitoring. Recorded seismic waveforms can be used to determine earthquake time, location, and magnitude and to analyze subsurface formations, faults, and reservoir structures.

Seismic data acquisition services will increasingly shift toward cable-free, nodal, and high-density acquisition. Lightweight autonomous nodes reduce the deployment and maintenance requirements associated with conventional seismic cables and support flexible operations in mountainous, desert, urban, and complex offshore environments. As node costs and power consumption decline, large-scale, wide-azimuth, high-density 3D surveys will become more common, improving wavefield sampling and subsurface imaging resolution. New-generation nodal systems will also provide stronger wireless quality control for battery status, GPS timing, storage capacity, and equipment

condition.

Real-time connectivity, automation, and intelligent data management will become major areas of service development. Satellite, radio, and other communication technologies will increasingly support field-data transmission and equipment-status monitoring, while artificial intelligence will assist with noise identification, anomaly detection, acquisition-quality assessment, and operational optimization. Demand will also expand beyond conventional hydrocarbon exploration into earthquake and volcano monitoring, seabed geological surveys, geothermal resources, mineral exploration, and carbon capture and storage projects. Competition will therefore increasingly depend on data quality, complex-environment operating capability, and integrated geophysical-service expertise.
