According to our (Global Info Research) latest study, the global Economizers market size was valued at USD 10050 million in 2023 and is forecast to a readjusted size of USD 13770 million by 2030 with a CAGR of 4.6% during review period.

With the growing regulations and restrictions pertaining to energy conservation and reduction of fuel consumption, global economizers market is expected to create significant growth opportunities for industry incumbents during the forecast period. An economizer is a mechanical device which acts as a heat exchanger by preheating the feed water to improve the efficiency of the process. Economizers utilize residual heat from combustion products i.e. fuel gases, thereby improving thermal efficiency of the process as the process then requires relatively lesser fuel for the pre-heating the water in order to produce steam. Thus, economizers help in fuel saving and economizing the process and hence are referred to as economizers. Economizers offer numerous benefits, such as waste heat recovery and reduction of carbon emissions. These economizers also help in cooling gases in power plants prior to desulphurization. Thus, economizers help in cost reduction and water conservation. Improved and more efficient economizers are being developed to further improve the efficiency of the process.

Increasing government regulations aiming to minimize fuel consumption and to ensure energy conservation have led to the growth of the global economizers market over the recent past. Reportedly, use of economizers enhances the fuel economy by around 5-7%. They also help in achieving a general reduction in cost and improved operational efficiency. Moreover, the rapid growth in the end use industries, such as construction, power generation, especially in the developing regions with rising urbanization and industrialization, is another major factor driving the growth of the market.
