According to our latest research, the global Ecotoxicity Testing market size will reach USD million in 2031, growing at a CAGR of %over the analysis period.

Ecotoxicity Testing is a testing method for evaluating the toxic effects of chemicals on organisms in the environment. It aims to determine the toxicity levels of chemicals to different biological tissues, populations or communities, and the extent to which these substances affect ecosystem structure and function. Such testing can cover a variety of different biological tissues, including microorganisms, plants, zooplankton, fish, amphibians, and mammals, as well as their different life stages and roles in the ecosystem.

Ecotoxicity Testing can help people evaluate the potential risks of chemical substances in the natural environment and provide scientific basis for environmental management and policy formulation. Such testing is often an important part of environmental impact assessment, chemical registration and management, environmental protection policy, etc.
