According to our (Global Info Research) latest study, the global Eddy Correlation System market size was valued at US\$ 185 million in 2025 and is forecast to a readjusted size of US\$ 297 million by 2032 with a CAGR of 6.9% during review period.

The Eddy Correlation System (ECS) is a scientific instrument used to measure gas exchange fluxes between ecosystems and the atmosphere. It calculates carbon dioxide, water vapor, and energy fluxes in real time by analyzing high-frequency fluctuations in vertical wind speed and gas concentration. This technology is crucial for studying the carbon cycle, greenhouse gas emissions, and energy exchange in ecosystems. The equipment is widely used in climate change research, carbon flux monitoring, ecosystem observation, and agricultural and forestry research, playing a key role in global carbon monitoring networks. The upstream of the industry chain includes suppliers of ultrasonic anemometers, gas analyzers, data loggers, and sensors; the midstream consists of system integrators responsible for measurement system integration, data acquisition modules, and analysis software development; downstream applications include research institutions, environmental monitoring networks, agricultural research centers, forestry departments, and climate research organizations. Global ECS production in 2025 is estimated at approximately 4,000 units, with an average market price of approximately US\$45,000 per unit. The gross profit margin of major companies in the industry is estimated at 38%-55%. Global production capacity in 2025 is estimated at approximately 5,333 units.
