According to our (Global Info Research) latest study, the global Edge Bead Removal (EBR) market size was valued at US$ million in 2025 and is forecast to a readjusted size of US$ million by 2032 with a CAGR of %during review period.

Edge Bead Removal (EBR) refers to a process in semiconductor manufacturing that removes excess coating at the edge of a wafer. During the spin-coating of photoresist onto a wafer, a thicker layer or "edge bead" often forms due to the physical nature of the spin process. If these edge beads are not removed, they can lead to defects in subsequent processing steps, such as coating uniformity issues, decreased lithographic pattern resolution, and even affect the overall planarity and functionality of the wafer. Therefore, EBR is a crucial step in ensuring wafer manufacturing quality.
