## Abstracts

According to our (Global Info Research) latest study, the global Edge Computing All-in-One market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Edge computing all-in-one is a new type of product that has emerged in recent years. It combines edge computing technology with all-in-one computers to provide users with a more efficient and convenient computing experience. As a distributed computing architecture, edge computing moves the computing of applications, data and services from the central node of the network to the logical edge nodes of the network for processing. The advantage of this architecture is that it can speed up data processing and transmission, reduce delays, and is more suitable for processing big data. As one of the applications of edge computing technology, edge computing all-in-one computer has many unique advantages. First of all, edge computing all-in-one machines can cut large services that are originally completely processed by central nodes into smaller and more manageable parts, and distribute them to edge nodes for processing. In this way, it can not only reduce the burden on the central node, but also improve the overall computing efficiency. Secondly, edge computing all-in-one computers are closer to user terminal devices and can process and transmit data faster, thereby providing a smoother user experience. In addition, the edge computing all-in-one machine can also analyze and generate knowledge at the source of data, which is closer to actual application scenarios and provides users with more accurate services.
