Abstracts

Edge computing is a distributed and open platform that integrates the core capabilities of network, computing, storage, and application closest to the source of things or data in the network, and provides edge intelligent services nearby. Providing services on the edge of the network closer to the terminal is the biggest feature of edge computing. For such a design, it can meet the key needs of various industries in terms of digital agile connection, real-time business, data optimization, application intelligence, security and privacy protection. Its advantages promote intelligence, connecting the two worlds of physical and digital in series.

In edge computing, terminal devices can complete storage and computing tasks at edge nodes. This change will produce two major advantages. First, because computing tasks can be performed at the edge, external computing power can effectively extend the computing capabilities of terminal devices. Second, it saves bandwidth resources due to computing tasks transmitted in the network. The core facility layer, edge computing center, edge network, and edge equipment are the four-layer functional structure of the basic edge computing architecture. This architecture can realize the 'cloud-side-end' synergy effect.

According to our (Global Info Research) latest study, the global Edge Computing market size was valued at US$ 11340 million in 2023 and is forecast to a readjusted size of USD 71230 million by 2030 with a CAGR of 30.4% during review period.

At present, major global manufacturers include IBM, Microsoft, Amazon Web Services, Dell, Cisco, HPE, Huawei, Lenovo, etc., and the global major manufacturers account for more than 60% in 2020.
