According to our (Global Info Research) latest study, the global Edge Computing Power Distribution Platform market size was valued at US\$ 8371 million in 2025 and is forecast to a readjusted size of US\$ 27179 million by 2032 with a CAGR of 18.3% during review period.

An edge computing power distribution platform refers to a computing power service platform built on edge computing, cloud computing, network scheduling, and distributed resource management technologies. By deploying edge nodes close to users, terminal devices, or data sources, it pushes computing, storage, network, and application capabilities down to the network edge and dynamically allocates, schedules, and delivers computing resources according to business needs. This platform typically features edge node management, computing resource pooling, task scheduling, containerized deployment, application distribution, traffic scheduling, low-latency computing, data localization processing, and security management. It is widely used in scenarios such as live video streaming, cloud gaming, AI inference, industrial internet, connected vehicles, IoT, smart cities, and content distribution. Its core value lies in reducing business access latency, reducing bandwidth pressure on central cloud servers, improving computing resource utilization, and providing flexible, elastic, and distributed computing power support for applications with high real-time and localized processing requirements. The basic concept of edge computing is to bring computing as close to the data source as possible to reduce latency and bandwidth usage; edge node services also typically emphasize the integrated provision of distributed computing, network, and storage resources.

The upstream of the edge computing power distribution platform industry chain mainly

includes edge servers, GPUs/AI accelerator cards, CPUs, storage devices, network equipment, optical modules, data center racks, operating systems, virtualization software, container platforms, cloud-native middleware, security software, and basic communication network resources, providing hardware, network, and software support for edge node construction and computing resource pooling. The midstream consists of edge computing power distribution platform service providers, whose core components include edge node deployment, computing resource scheduling, task distribution, containerized application deployment, traffic scheduling, AI model distribution, local data processing, low-latency network optimization, monitoring and maintenance, and security management. The downstream primarily serves customers in industries such as live video streaming, cloud gaming, AI inference, industrial internet, connected vehicles, IoT, smart cities, finance, healthcare, online education, and content distribution, aiming to reduce business latency, alleviate central cloud bandwidth pressure, and improve local real-time processing capabilities and user experience. The gross profit margin of edge computing power distribution platforms is approximately 63%.

From an industry value perspective, edge computing power distribution platforms are crucial infrastructure for extending cloud computing capabilities to the network edge. With the rapid development of low-latency, high-concurrency services such as live video streaming, cloud gaming, AI inference, industrial internet, connected vehicles, and the Internet of Things, relying solely on centralized cloud computing is no longer sufficient to meet the demands for real-time processing and proximity-based response. Edge computing power distribution platforms, by deploying computing, storage, network, and application capabilities closer to users or data sources, effectively reduce access latency, alleviate backhaul bandwidth pressure, and improve service stability and user experience.

From a competitive landscape perspective, the core competitiveness of edge computing power distribution platforms lies primarily in edge node coverage, computing power scheduling capabilities, network quality, platform openness, and security management capabilities. Large cloud service providers, telecom operators, and CDN vendors typically possess strong node resources, network resources, and a large enterprise customer base, giving them a first-mover advantage in scenarios such as video, content distribution, cloud gaming, and AI inference. Specialized edge computing platforms, on the other hand, can provide more flexible and customized solutions tailored to specific industry scenarios, such as industrial sites, connected vehicles, smart parks, edge AI boxes, and localized data processing. Future industry competition will shift from simply competing on the number of nodes to competing on comprehensive capabilities encompassing node coverage, computing resources, scheduling algorithms, industry

applications, and security compliance.

Looking at future trends, edge computing power distribution platforms will further evolve towards cloud-edge collaboration, AI-native technologies, and the convergence of computing and networks. With the growth of applications such as large-scale model inference, real-time video analytics, intelligent manufacturing, and autonomous driving, edge nodes will undertake more local computing, data filtering, model inference, and real-time decision-making tasks. Future platforms will not only need to provide computing resources but also possess capabilities such as containerized deployment, automatic elastic scaling, cross-node scheduling, model distribution, data security, and operational monitoring. Overall, edge computing power distribution platforms will gradually upgrade from basic resource distribution platforms to a crucial foundation supporting real-time intelligent applications and distributed digital infrastructure.
