According to our (Global Info Research) latest study, the global Edge Computing System market size was valued at US\$ 36839 million in 2025 and is forecast to a readjusted size of US\$ 170891 million by 2032 with a CAGR of 23.9% during review period.

Edge computing is a distributed and open platform that integrates the core capabilities of network, computing, storage, and application closest to the source of things or data in the network, and provides edge intelligent services nearby. Providing services on the edge of the network closer to the terminal is the biggest feature of edge computing. For such a design, it can meet the key needs of various industries in terms of digital agile connection, real-time business, data optimization, application intelligence, security and privacy protection. Its advantages promote intelligence, connecting the two worlds of physical and digital in series. In edge computing, terminal devices can complete storage and computing tasks at edge nodes. This change will produce two major advantages. First, because computing tasks can be performed at the edge, external computing power can effectively extend the computing capabilities of terminal devices. Second, it saves bandwidth resources due to computing tasks transmitted in the network. The core facility layer, edge computing center, edge network, and edge equipment are the four-layer functional structure of the basic edge computing architecture. This architecture can realize the 'cloud-side-end' synergy effect.

1) Explosive growth of IoT devices and data generation

The rapid proliferation of Internet of Things (IoT) devices across industries is a fundamental driver of the Edge Computing Solution market. Billions of connected

devices—ranging from industrial sensors and smart cameras to autonomous machines—are continuously generating massive volumes of data. Transmitting all this data to centralized cloud environments is inefficient due to bandwidth limitations, latency constraints, and rising data transfer costs. Edge computing addresses this challenge by enabling data processing closer to the source, significantly reducing network congestion and improving system responsiveness. As industries such as manufacturing, transportation, energy, and smart cities continue to deploy large-scale IoT infrastructures, the need for scalable and efficient edge computing solutions is accelerating.

2) Demand for ultra-low latency and real-time processing

Many modern applications require near-instantaneous data processing and decision-making, which traditional cloud computing architectures cannot always provide due to latency issues. Edge computing solutions enable real-time analytics by processing data locally or near the data source, making them critical for latency-sensitive use cases such as autonomous vehicles, industrial automation, augmented/virtual reality, and remote healthcare monitoring. In sectors like manufacturing and logistics, even milliseconds of delay can impact operational efficiency or safety, while in applications like autonomous driving or robotics, latency can directly affect system performance and reliability. This growing demand for real-time capabilities is a key factor driving widespread adoption of edge computing solutions.

3) Expansion of 5G networks and distributed computing infrastructure

The global rollout of 5G networks is significantly accelerating the adoption of edge computing solutions by enabling high-speed, low-latency connectivity and supporting distributed computing architectures. Technologies such as Multi-access Edge Computing (MEC) integrate edge capabilities directly into telecom networks, allowing service providers and enterprises to deploy applications closer to end users. This synergy between 5G and edge computing is unlocking new opportunities in areas like smart cities, connected vehicles, industrial IoT, and immersive digital experiences. At the same time, cloud providers and enterprises are investing in distributed edge data centers and hybrid cloud-edge platforms, further strengthening the infrastructure needed to support edge computing deployment at scale.
