Abstracts

The global Edible Soybean Meal market size is expected to reach \$ 10775 million by 2032, rising at a market growth of 3.5% CAGR during the forecast period (2026-2032).

In 2025, global edible soybean meal production reached approximately 6846 kilotons, the average price is 1200 usd/ton. Edible soybean meal is a processed product derived from soybeans after the oil has been extracted. It's a valuable source of protein, making it a key ingredient in animal feed, particularly for livestock and poultry. Unlike industrial soybean meal, edible soybean meal is specifically processed to meet food safety standards and is suitable for human consumption, though its direct use in human food is less common than its use in animal feed. It's characterized by its high protein content, relatively low fiber, and good amino acid profile, making it a nutritious and cost-effective protein supplement. It's crucial for the growth and development of animals, contributing significantly to meat and dairy production.

Market Concentration and Major Players:

Internationally, the edible soybean meal market is highly concentrated, primarily in developed countries such as Europe and the United States. Large manufacturers include Cargill and Bunge. Domestically, the edible soybean meal market still has significant room for growth.

Manufacturing Process and Market Trends:

The production of edible soybean meal begins with cleaning, impurity removal, and conditioning of high-quality soybeans. Oil is then extracted using pressing or solvent extraction. The resulting meal is then subjected to high-temperature, short-time

desolventizing, mechanical crushing, and fine pulverization to produce powdered or granular products. Strict temperature and time control are crucial during this process to deactivate anti-nutritional factors and preserve protein activity. Some high-end products also require alcohol washing to remove oligosaccharides or enzymatic modification to improve digestibility and absorption.

In terms of market trends, the industry continues to expand with the rise of plant-based diets, and products are upgrading towards functional specialty proteins with high gelation, high emulsification, and low allergenicity to meet the needs of meat product substitution, dairy product simulation, and snack food innovation. At the same time, driven by low-carbon environmental protection and the circular economy, the production side is accelerating the promotion of low-energy desolvation processes and near-zero wastewater discharge technologies, and actively developing non-GMO, organic certified, and traceable supply chain products to meet global food safety standards and the trend of clean label consumption.
