According to our (Global Info Research) latest study, the global EDM Punching Machine market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

An electric spark punching machine, also known as an electric spark discharge punching machine, is a machine and equipment that uses the principle of spark discharge to perform punching processing. It generates high-frequency and high-voltage spark discharges on the surface of the workpiece to instantly melt a local area on the surface of the workpiece, and then blows away the melted metal particles by injecting gas or fluid to form a hole. The working principle of the electric spark punching machine is to use the spark discharge phenomenon between the electrode and the workpiece to form an spark discharge channel between the electrode and the workpiece through the action of high-voltage current and voltage. During electric spark discharge, high-temperature, high-pressure plasma is generated between the electrode and the workpiece, causing local areas of the workpiece surface to instantly melt. The molten metal particles are then blown away by jets of gas or fluid to form a hole. The EDM puncher is suitable for processing materials with high hardness and poor thermal conductivity, such as carbide, ceramics, quartz glass, steel, etc. It is widely used in mold manufacturing, precision parts processing, electronic device manufacturing and other fields, and can achieve high-precision and high-efficiency punching processing.
