Abstracts

Electroencephalogram (EEG) is used to diagnose brain disorders and visualizes the activity of the brain during a seizure. EEG evaluates people who are suffering from brain problems such as coma, confusions and tumors, difficulties in thinking and memory and weakening of specific parts of the body. Electromyography (EMG) measures the electrical activity of muscles at the time of rest and contraction. An EMG uses tiny devices called electrodes which help in transmission and detection of electrical signals. Evoked Potential devices are used to clinically diagnose a wide variety of central nervous system (CNS) diseases.
