According to our (Global Info Research) latest study, the global Egg-Based Flu Vaccines market size was valued at USD 7330.2 million in 2022 and is forecast to a readjusted size of USD 10170 million by 2029 with a CAGR of 4.8% during review period.

The most common way that flu vaccines are made is using an egg-based manufacturing process. that has been used for more than 70 years. Egg-based vaccine manufacturing is used to make both inactivated (killed) vaccine (usually called the “flu shot”) and live attenuated (weakened virus) vaccine (usually called the “nasal spray flu vaccine”).

A significant driver in the Influenza Vaccine market is the growing awareness of the importance of vaccination in preventing seasonal and pandemic influenza outbreaks. As healthcare organizations and governments worldwide promote vaccination as a crucial public health measure, there is an increasing demand for influenza vaccines. Additionally, advances in vaccine research and development, including the production of more effective and broader-spectrum vaccines, are driving market growth. One of the key challenges in this market is the need for frequent vaccine updates to match evolving influenza strains. The virus undergoes genetic changes, requiring annual adjustments to vaccine formulations. This presents logistical challenges for manufacturers in terms of timely production and distribution. Vaccine hesitancy and misinformation also pose challenges by impacting vaccination rates and public perception. Lastly, ensuring equitable access to vaccines, especially in low-income and underserved populations, remains a persistent challenge in the fight against influenza.
