Abstracts

The global Elastic Wrap Bandage market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

An elastic wrap bandage is a 'stretchable bandage used to create localized pressure'. Elastic wrap bandages are commonly used to treat muscle sprains and strains by reducing the flow of blood to a particular area by the application of even stable pressure which can restrict swelling at the place of injury. Elastic bandages are also used to treat bone fractures. Padding is applied to the fractured limb, then a splint (usually plaster) is applied. The elastic bandage is then applied to hold the splint in place and to protect it. This is a common technique for fractures which may swell, which would cause a cast to function improperly. These types of splints are usually removed after swelling has decreased and then a fiberglass or plaster cast can be applied.

This report studies the global Elastic Wrap Bandage production, demand, key manufacturers, and key regions.
