Abstracts

The global Electric Aircraft Jack market size is expected to reach \$ 40.14 million by 2032, rising at a market growth of 5.9% CAGR during the forecast period (2026-2032).

In 2025, the global production of electric aircraft jacks reached 4,680 units, with an average selling price of \$5,590 per unit. Electric aircraft jacks are specialized jacks used for lifting and supporting aircraft during maintenance. They utilize an electric motor to drive a hydraulic pump, creating pressure to complete lifting and lowering operations. Applications are primarily concentrated in base maintenance and overhaul bays for aircraft mechanics and third-party MROs, manufacturing assembly and pre-delivery inspections, and maintenance scenarios for narrow-body and wide-body aircraft requiring more precise cycle time. The upstream of the industry chain includes high-strength steel structures and welded components, hydraulic cylinders and multi-stage telescopic pistons, valve assemblies and overflow protection, seals and aviation hydraulic fluid adapters, as well as electric motors and pumps, control cabinets and safety interlocks, cables and connectors, load sensors and gauges, etc.; the midstream consists of manufacturers and system integrators; and downstream customers are airlines, airport maintenance units, third-party MROs, and military support systems. Gross profit margins range from 25% to 40%.

Technically, the main focus is on higher levels of automation and a closed-loop safety system: electro-hydraulic pumps and handheld controllers improve visibility and operational efficiency; synchronous lifting and leveling systems and load monitoring systems are becoming standard, reducing human error; automated safety locking mechanisms require electro-hydraulic jacks as a prerequisite to reduce the risk of manual tightening and missed tightening, and to improve cycle time; simultaneously, at the asset management level, jacks are incorporated into digital verification and status

management, forming a traceable system from tooling to processes. Regionally, North America and Europe, due to their large fleet size, centralized third-party MRO operations, and high degree of hangar workstation integration, are typically mature markets with faster electrification penetration; the Asia-Pacific region, driven by fleet expansion and maintenance capacity building, is experiencing faster growth and increasing demand for mid-to-high-end workstation equipment; the Middle East, driven by wide-body aircraft operations and hub airport maintenance capabilities, has a more prominent demand for high-tonnage and complete synchronous lifting systems.
