According to our (Global Info Research) latest study, the global Earth Observation Satellite market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Earth observation satellite is designed for non-military uses, such as monitoring and predicting climatic patterns, assessing damage during natural disasters, estimation of crop yields, surface geology mapping, and mineral deposits, and availability of water sources. It works at an altitude of 800 Km using remote-sensing techniques to collect data on the chemical, physical, and biological aspects of the earth system. This method permits the measurement of geology parameters of the world from the orbit with the use of high-resolution cameras and advanced sensors. It conjointly facilitates the management of earth's natural resources in a resourceful manner.

The satellite-based earth observation sector is witnessing a rapid growth during the forecast period. However, there are some shortcomings in operating performance of the earth observation satellite, such as high initial investment cost, coordination among different databases, reusability, customization, and isolation of various satellites from one another.
