According to our (Global Info Research) latest study, the global Electric Cat Massager market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

Electric cat massagers are usually small and exquisite, shaped like small paws or devices with massage contacts, which can be placed on the cat's head, neck and other parts for massage. For example, some head massagers are designed with four contacts, which can simulate the scratching action of human hands and bring a comfortable massage experience to the cat's head. Vibration is generated by the motor and transmitted to the contact part of the massager, thereby stimulating the cat's body. The frequency and intensity of vibration can be adjusted according to different massagers. Generally speaking, low-frequency vibration is more suitable for cats' daily relaxation, while high-frequency vibration can be used for deep massage. The massage contacts or massage balls are driven by mechanical devices to rotate, squeeze and other actions to massage the cat's muscles. This massage method can help cats relieve muscle fatigue and promote blood circulation.
