Abstracts

The global Electric CNC Bending Machine market size is expected to reach \$ 2212 million by 2032, rising at a market growth of 6.3% CAGR during the forecast period (2026-2032).

In 2025, global Electric CNC Bending Machine production reached approximately 8.2k units, with an average global market price of around US\$170k per unit.

An electric CNC bending machine is a CNC sheet-metal bending machine driven by servo motors—often through ball-screw or direct-drive mechanisms—so the ram stroke, speed, and force/torque control are managed precisely by the CNC system for V-bending, forming, and hemming. Compared with hydraulic machines, servo-electric CNC models typically deliver higher repeatability, lower energy consumption, and reduced maintenance (oil-free or low-oil), making them well suited for thin-to-medium gauge, high-mix/low-volume production and automated bending cells.

Upstream includes servo motors/drives, precision transmissions (ball screws, linear guides), steel frames/ram fabrications, CNC controls/software (including compensation and offline programming), sensors (position feedback, angle measurement, deflection/springback compensation), and tooling (punch/die, quick clamping). Midstream OEMs integrate these into servo-electric press brakes with calibrated accuracy, safety systems, and optional robot/cell integration. Downstream demand comes from sheet-metal fabrication (enclosures/cabinets), appliances, automotive & NEVs (battery enclosures/structures), construction machinery, rail, HVAC ducting, and metal furniture. Representative ecosystem players include machine/solution brands (e.g., AMADA's servo-electric press brake lines) and commercial suppliers of servo-electric press brakes (e.g., DENER servo-electric offerings).

????????????????200?,????25%-45%?

The annual production capacity of a single-line Electric CNC Bending Machine is approximately 200 unit, with a gross profit margin of approximately 25%-45%.
