Abstracts

The global Electric-driven Fracturing Skid market size is expected to reach \$ 949 million by 2032, rising at a market growth of 5.4% CAGR during the forecast period (2026-2032).

In 2025, global electric-driven fracturing skids production reached approximately 1995 units, the average price is 320 k usd/unit. Electric-driven fracturing skids are specialized equipment for shale oil/gas field development powered by electricity. Powered by industrial power grids or gas-fired generators, they drive a variable frequency motor via a variable frequency control system to directly drive an electric fracturing pump. This pump injects high-pressure, high-volume fracturing fluid into the wellbore to break up the formation and force proppant into the fractures, improving oil and gas permeability. Structurally, a skid-mounted base integrates the electric fracturing pump, variable frequency control system, intelligent monitoring, and auxiliary piping onto a single platform, allowing for modular expansion into a complete electric fracturing fleet. Essentially, it replaces the traditional diesel engine and gearbox with an electric motor and VFD (Variable Frequency Drive), achieving stepless speed regulation, a single-unit power output of 5000?8000 horsepower, and significantly reduced noise and emissions. It is the main equipment for the 'electricity-for-oil' fracturing route in domestic shale gas and North American fracturing.

The gross profit margin of electric-driven fracturing skids is around 22%.
