According to our (Global Info Research) latest study, the global Electric LRD Overload Relay market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

Electric LRD Overload Relays are protective devices designed to safeguard electrical circuits from excessive current loads. They are crucial components in various electrical systems, preventing potential damage to equipment and ensuring safe operation.

LRD typically stands for 'Long-Time Retard' or 'Long-Time Inverse,' indicating that the relay has a delayed response to overload currents. This delay allows for short-term overloads that might occur during normal operation (e.g., motor starting) without triggering a trip.

Overload Relays work by monitoring the current flowing through a circuit. When the current exceeds a predetermined threshold for an extended period, the relay activates, interrupting the power supply to protect the circuit.
