Abstracts

The global Electric Motor Silicon Steel Lamination market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Electric Motor Silicon Steel Sheets are one of the key materials used in manufacturing electric motors. It is usually made of silicon steel plate, also known as electrical steel or silicon steel sheet. Silicon steel sheet is a special cold-rolled steel sheet with excellent magnetic permeability and low hysteresis loss.

The main function of the motor silicon steel sheet is to reduce the iron loss and hysteresis loss of the motor and improve the efficiency of the motor. Since a magnetic field is generated in the motor, the high magnetic permeability of the silicon steel sheet can effectively conduct the magnetic field and reduce energy loss. In addition, silicon steel sheets can also reduce eddy current losses and improve the power factor of the motor.

Silicon steel sheets usually have high specific resistance and thin thickness, which helps reduce eddy current losses and hysteresis losses. In order to achieve higher efficiency, silicon steel sheets usually require special processing and treatment, such as cold rolling, annealing and surface insulation treatment. These treatments can make the silicon steel sheets have better electromagnetic properties.
