Abstracts

The global Electric Multi-Component Injection Molding Machine market size is expected to reach \$ 3447 million by 2032, rising at a market growth of 5.9% CAGR during the forecast period (2026-2032).

Electric multi-component injection molding machine is an advanced injection molding equipment that utilizes servo motors to precisely control injection and mold closing actions, enabling the sequential or simultaneous injection of two or more different materials/colors of plastic onto a single machine. Their core function is to achieve efficient one-time molding of complex components with multiple materials and colors, solving the problems of low efficiency, poor precision, and weak interface strength caused by multiple processing and assembly steps required in traditional single-component injection molding. Furthermore, the all-electric drive improves energy efficiency, quietness, and process stability, making them particularly suitable for the manufacturing of high-end integrated products such as automotive parts, electronic housings, and medical devices. The upstream mainly includes core component suppliers (such as servo motors, ball screws, precision molds, and control systems) and raw material suppliers such as special engineering plastics; the downstream directly serves end-user manufacturing industries, covering automotive (lights, buttons), consumer electronics (dual-color buttons, seals), medical (dual-soft-hard composite devices), and packaging industries. In 2025, the production volume of electric multi-component injection molding machines is estimated at approximately 15,000 units, with an average price of approximately US\$150,000 per unit, a gross profit margin of approximately 35%, and a single-line capacity of approximately 300 units per year.
