## Abstracts

A multileaf collimator (MLC) is a Collimator or beam-limiting device that is made of individual 'leaves' of a high atomic numbered material, usually tungsten, that can move independently in and out of the path of a radiotherapy beam in order to shape it and vary its intensity. The electric multileaf collimator blades are driven by micro motors, allowing the blades to be quickly positioned to any specified position.

MLCs are used in external beam radiotherapy to provide conformal shaping of beams. Specifically, conformal radiotherapy and Intensity Modulated Radiation Therapy (IMRT) can be delivered using MLCs.
