Electric Scooter Motor is one of the core components of the electric scooter power system, responsible for converting electrical energy into mechanical energy to drive the scooter forward. The motor is supplied with current through the power supply, and the current is converted into DC through the rectifier, and then the current size and direction are controlled by the electric regulator, thereby controlling the speed and direction of the motor. At present, DC motors are mainly used, especially DC brushless motors, which have higher efficiency and longer service life. Choosing the right motor type and performance parameters is crucial to improving the overall performance of the scooter.
