According to our (Global Info Research) latest study, the global Electric Servo Manipulator market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

The electric servo manipulator is a mechanical arm system driven by an electric motor. Through the rotation and control of the electric motor, the movement and attitude control of the mechanical arm can be realized. The electric servo manipulator is usually composed of multiple joints, each joint is driven by a motor, and the movement of the mechanical arm is realized by controlling the rotation angle and speed of the motor. The joints of the electric servo manipulator usually use a combination of a motor and a reducer. The motor provides power, and the reducer reduces the speed of the motor and increases the torque to meet the movement needs of the robot arm. The electric servo manipulator is flexible and precise, and can perform complex movements and precise positioning. It is widely used in the field of industrial automation, such as material handling, welding, spraying and other operations on the assembly line, as well as surgical robots in the medical field, and sample processing in the laboratory. The application of electric servo manipulator can improve production efficiency, reduce labor costs, and can operate in dangerous environments to improve work safety.
